Acute Oral Toxicity	Male and Female Rat: LD50: > 2,000 mg/kg
Acute Dermal Toxicity	Male and Female Rat: LD50: > 4,000 mg/kg
Acute Inhalation Toxicity	Male and Female Rat: LC50: 4-hr exposure to liquid aerosol: > 1.975 mg/l

Eye Irritation	Rabbit: Non-irritating.
Sensitization	Guinea pig: Not a dermal sensitizer.
Sub-Chronic Toxicity	In a 3 week dermal toxicity study, rabbits treated with tebuconazole showed no local or systemic effects at levels up to and including 1000 mg/kg, the limit dose. In a 3 week inhalation study, rats exposed to tebuconazole exhibited liver enzyme effects at the highest concentration tested (155.8 mg/m ³).
Chronic Toxicity	In chronic dietary studies in rats and dogs treated with tebuconazole, effects on the liver, spleen, adrenals and/or eyes occurred at high doses.

Assessment Carcinogenicity

Tebuconazole gave no evidence of a carcinogenic potential in an oncogenicity study in rats, however, in a study using mice there was an increased incidence of hepatocellular neoplasms at a dose level approximately three-fold greater than the maximum tolerated dose (MTD).

ACGIH None NTP None IARC None OSHA None	
Reproductive & Developmental Toxicity	In a two generation study in rats treated with tebuconazole, smaller litters and decreased pup body weights were observed in conjunction with maternal toxicity at the highest concentration tested (1000 ppm).
	Tebuconazole produced teratogenic effects in conjunction with maternal toxicity in mice and rabbits via oral and/or dermal exposure. When tested in the rat, developmental effects were observed in conjunction with maternal toxicity via oral exposure. Teratogenic effects were not observed in the rat following either route of exposure.
Neurotoxicity	In an acute oral neurotoxicity screening study in rats, tebuconazole produced transient neurobehavioral effects without correlating morphological changes in neural tissues.
	In a subchronic dietary neurotoxicity screening study in rats, tebuconazole did not produce any neurobehavioral symptoms or any microscopic lesions in neural tissues or skeletal muscle.
	In a one-generation developmental neurotoxicity study in rats, dietary concentrations of tebuconazole administered to the dams during gestation and lactation did not cause any specific neurobehavioral effects in the offspring. Clinical signs of toxicity, as well as, developmental toxicity were observed in the offspring, but only in conjunction with maternal toxicity.
